Assignment 2

1. Download the dataset from the source here.

About the dataset:

This dataset is all about churn modelling of a credit company. It has the details about the end user who are using credit card and also it has some variables to depicit the churn of the customer.

RowNumber - Serial number of the rows **CustomerId** - Unique identification of customer **Surname** - Name of the customer **CreditScore** - Cipil score of the customer **Geography** - Location of the bank **Gender** - Sex of the customer **Age** - Age of the customer **Tenure** - Repayment period for the credit amount **Balance** - Current balance in thier creidt card **NumOfProducts** - Products owned by the customer from the company **HasCrCard** - Has credit card or not (0 - no , 1 - yes) **IsactiveMember** - Is a active member or not **EstimatedSalary** - Salary of the customer **Exited** - Churn of the customer

```
import warnings
warnings.filterwarnings("ignore")
import pandas as pd
import numpy as np
import seaborn as sns
import matplotlib.pyplot as plt
```

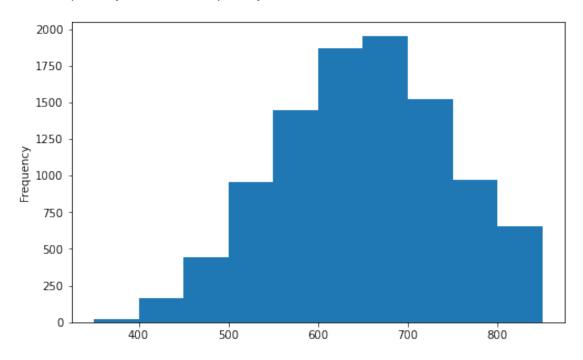

2. Load the dataset

```
df = pd.read_csv("Churn_Modelling.csv")
df.head()
```

\	RowNumber	CustomerId	Surname	CreditScore	Geography	Gender	Age
0	1	15634602	Hargrave	619	France	Female	42

3 a). Univariate analysis
#checking for categorical variables
category = df.select dtypes(include=[np.object])
print("Categorical Variables: ",category.shape[1])
#checking for numerical variables
numerical = df.select dtypes(include=[np.int64,np.float64])
print("Numerical Variables: ",numerical.shape[1])
```

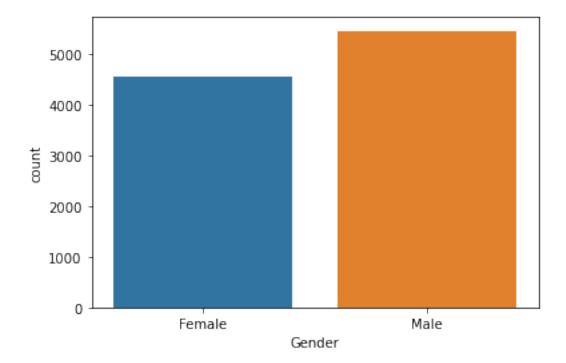

geo = df['Geography'].value_counts()
geo.plot(kind="pie",figsize=(10,8))

<AxesSubplot:ylabel='Geography'>

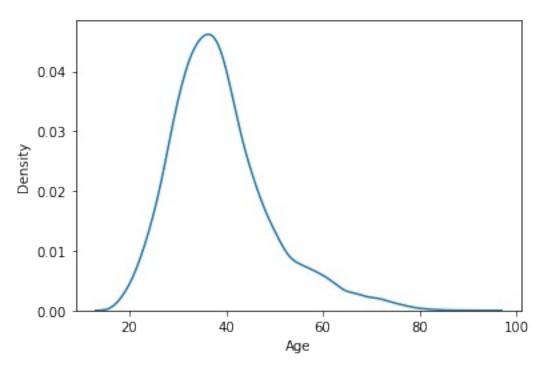

sns.countplot(df['Gender'])
<AxesSubplot:xlabel='Gender', ylabel='count'>

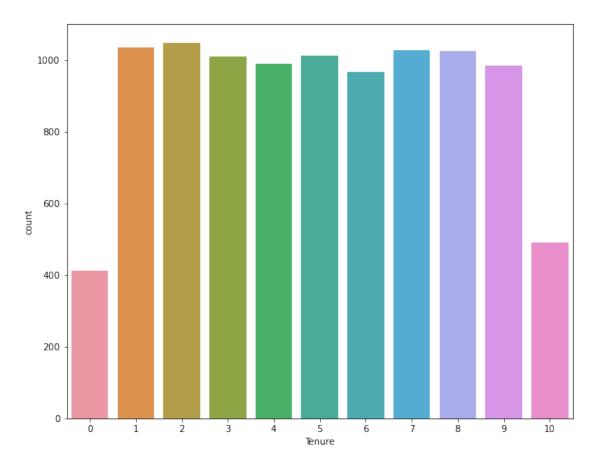

sns.distplot(df['Age'],hist=False)

<AxesSubplot:xlabel='Age', ylabel='Density'>

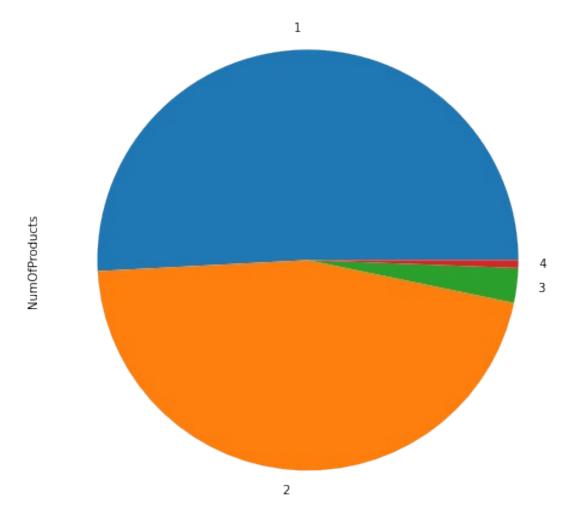

plt.figure(figsize=(10,8))
sns.countplot(df['Tenure'])

<AxesSubplot:xlabel='Tenure', ylabel='count'>

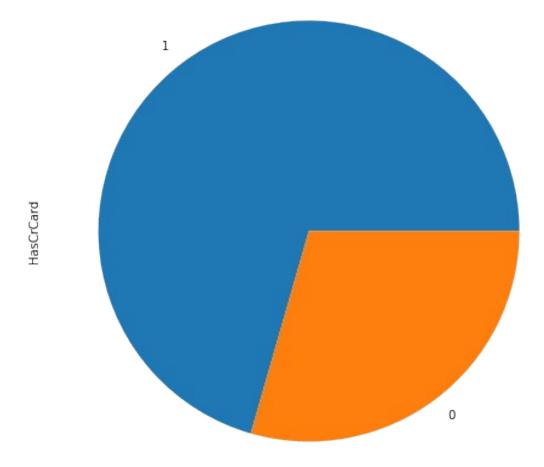

product = df['NumOfProducts'].value_counts()
product.plot(kind="pie",figsize=(10,8))

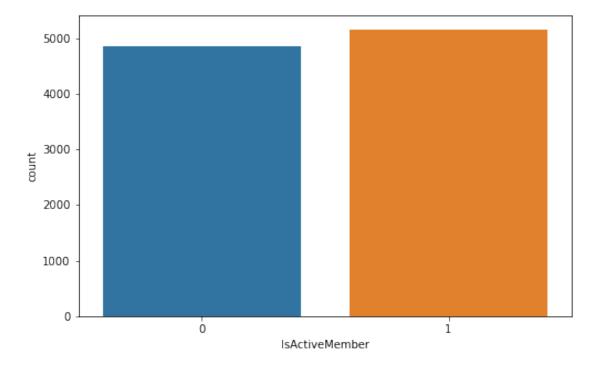

<AxesSubplot:ylabel='NumOfProducts'>

```
cr = df['HasCrCard'].value_counts()
cr.plot(kind="pie",figsize=(10,8))
<AxesSubplot:ylabel='HasCrCard'>
```

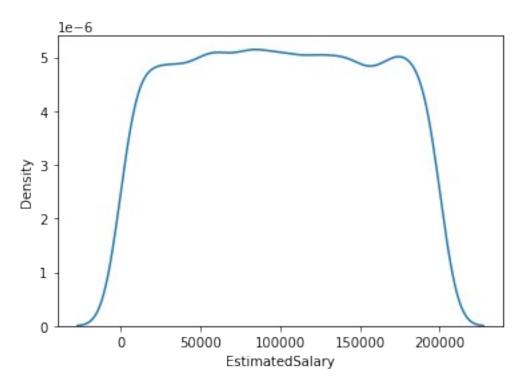

```
plt.figure(figsize=(8,5))
sns.countplot(df['IsActiveMember'])
<AxesSubplot:xlabel='IsActiveMember', ylabel='count'>
```

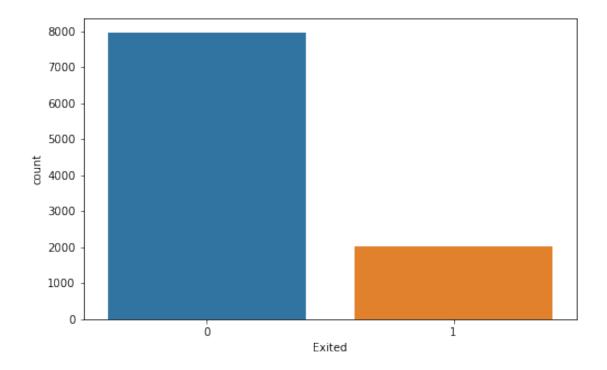

sns.distplot(df['EstimatedSalary'],hist=False)

<AxesSubplot:xlabel='EstimatedSalary', ylabel='Density'>

plt.figure(figsize=(8,5))
sns.countplot(df['Exited'])

<AxesSubplot:xlabel='Exited', ylabel='count'>

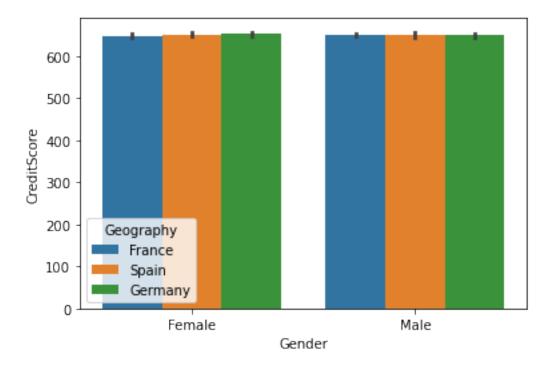

Inference:

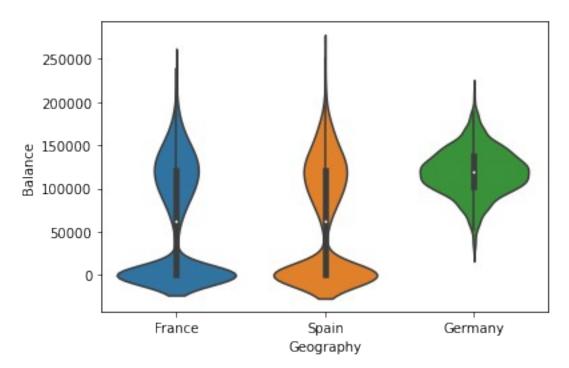

- 1. The data has 11 numerical variables and 3 categorical variables.
- 2. It has 10000 rows and 14 columns
- 3. The normalized credit score is around 700, More than 500 people have credit score greater than 800.
- 4. France occupies 50% of customers, where as Germany and Spain shared equal.
- 5. Dataset is dominated by Male Customers.
- 6. Median age is around 40 to 45.
- 7. Highest number of customer has thier tenure period for 2 years.
- 8. Credit company has maximum customers, who uses single product.
- 9. Most of the customer has credit card.
- 10. More than 40% of the population is not an active member.
- 11. The Churn is less compared to the satisfaction. **Dataset is imbalanced.**

3 b). Bivariate analysis

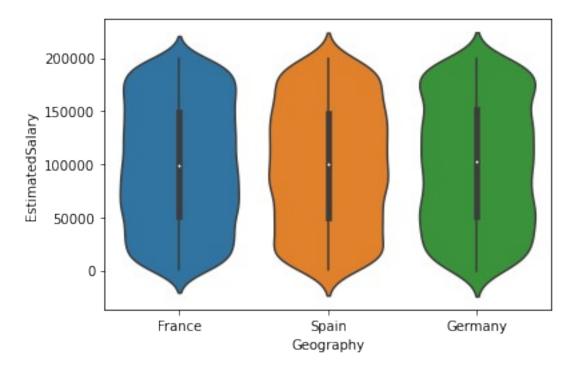

```
sns.barplot(x='Gender',y='CreditScore',hue='Geography',data=df)
<AxesSubplot:xlabel='Gender', ylabel='CreditScore'>
```

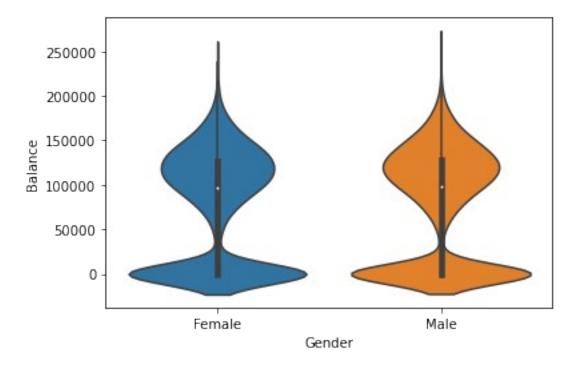

sns.violinplot(x='Geography',y='Balance',data=df)
<AxesSubplot:xlabel='Geography', ylabel='Balance'>

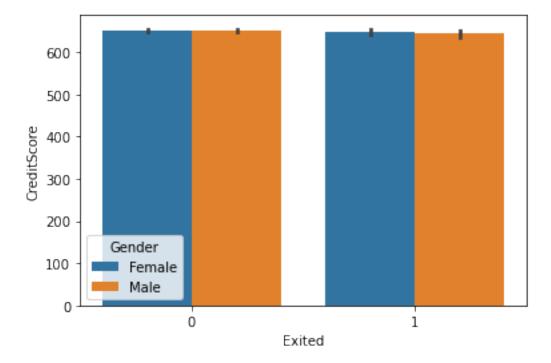

sns.violinplot(x='Geography',y='EstimatedSalary',data=df)
<AxesSubplot:xlabel='Geography', ylabel='EstimatedSalary'>

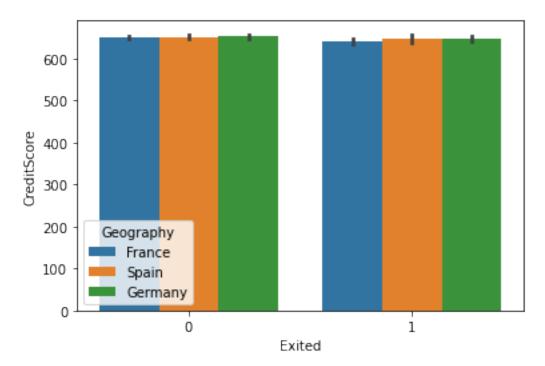

sns.violinplot(x='Gender',y='Balance',data=df)
<AxesSubplot:xlabel='Gender', ylabel='Balance'>

sns.barplot(x='Exited',y='CreditScore',hue='Gender',data=df)
<AxesSubplot:xlabel='Exited', ylabel='CreditScore'>

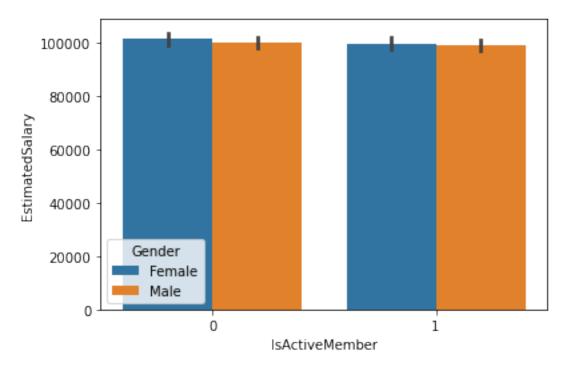

sns.barplot(x='Exited',y='CreditScore',hue='Geography',data=df)
<AxesSubplot:xlabel='Exited', ylabel='CreditScore'>

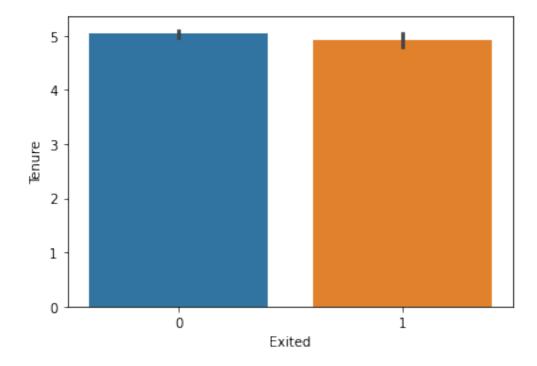

sns.barplot(x='IsActiveMember',y='EstimatedSalary',hue='Gender',data=d
f)

<AxesSubplot:xlabel='IsActiveMember', ylabel='EstimatedSalary'>

sns.barplot(x='Exited',y='Tenure',data=df)
<AxesSubplot:xlabel='Exited', ylabel='Tenure'>

Inference:

1. Credit score for Male is higher in Spain.

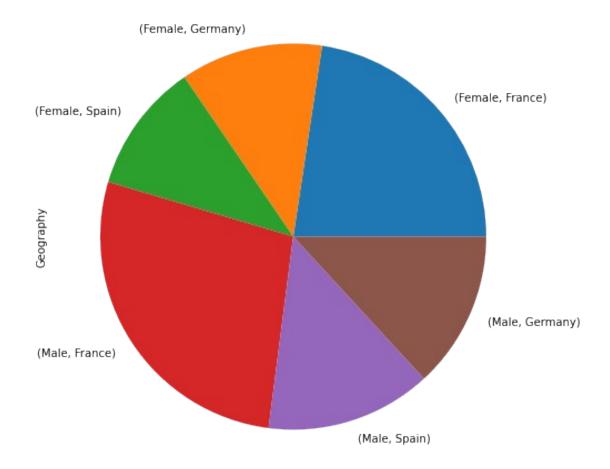

- 2. Average bank salary lies in the range of 100k to 150k.
- 3. Estimated salary is normalized and same for all country.
- 4. Credit score for churn is low.
- 5. Churn in Germany is higher compared to other countries.
- 6. Exited people tenure period is around 6 years.

3 c). Multivariate analysis

```
gp1 = df.groupby('Gender')['Geography'].value_counts()
gp1.plot(kind='pie',figsize=(10,8))
print(gp1)
```

Gender	Geography	
Female	France	2261
	Germany	1193
	Spain	1089
Male	France	2753
	Spain	1388
	Germany	1316

Name: Geography, dtype: int64

```
gp2 = df.groupby('Gender')['Age'].mean()
print(gp2)
Gender
```

Female 39.238389 Male 38.658237

Name: Age, dtype: float64

gp3 = df.groupby(['Gender','Geography'])['Tenure'].mean()
print(gp3)

. م مدر خالم	C 1		

dtype: int64

Inference:

- 1. Germany has more female customers compared to male customers.
- 2. Average age of Male is 38, whereas average age of Female is 39.
- 3. Tenure period for both male and female is high in Spain.
- 4. It is observed that, those who have credit card are very active member in the company.

- The estimated salary for a person who is not having credit card is high when 5. compared to those having them.
- Churn for inactive member is high compared to active member. 6.
- Those who churn has thier estimated salary very low. 7.
- France has the more churn rate. 8.

df.isnull().sum()

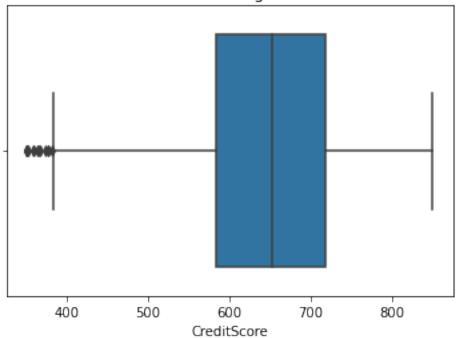

There is no missing value in the dataset

6. Finding outliers

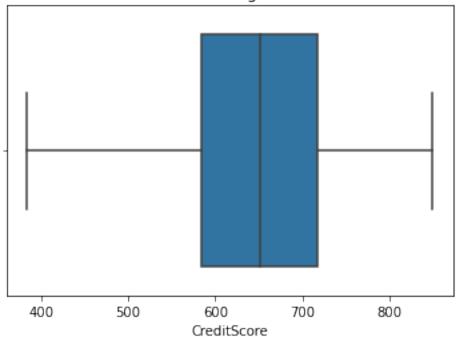

```
def replace_outliers(df, field_name):
    Q1 = np.percentile(df[field_name],25,interpolation='midpoint')
    Q3 = np.percentile(df[field_name],75,interpolation='midpoint')
    IQR = Q3-Q1
    maxi = Q3+1.5*IQR
    mini = Q1-1.5*IQR
    df[field_name]=df[field_name].mask(df[field_name]>maxi,maxi)
    df[field_name]=df[field_name].mask(df[field_name]<mini,mini)

plt.title("Before removing outliers")
sns.boxplot(df['CreditScore'])
plt.show()
plt.title("After removing outliers")
replace_outliers(df, 'CreditScore')
sns.boxplot(df['CreditScore'])
plt.show()</pre>
```

Before removing outliers

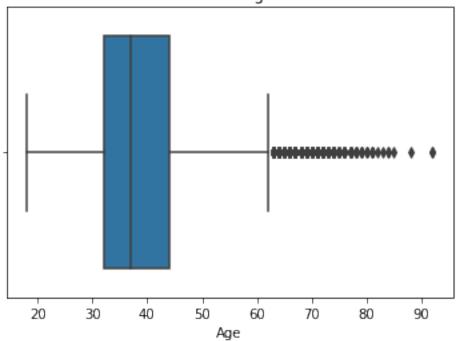

After removing outliers

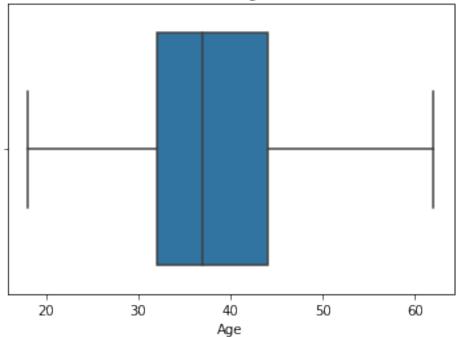

```
plt.title("Before removing outliers")
sns.boxplot(df['Age'])
plt.show()
plt.title("After removing outliers")
replace_outliers(df, 'Age')
```

```
sns.boxplot(df['Age'])
plt.show()
```

Before removing outliers

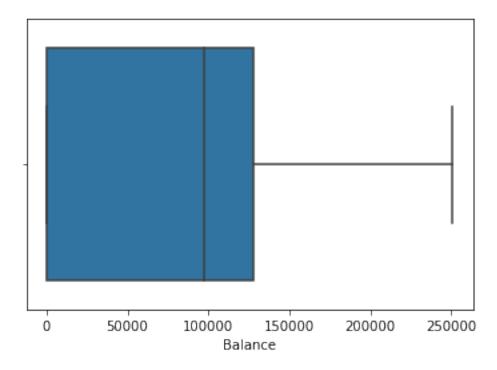

After removing outliers

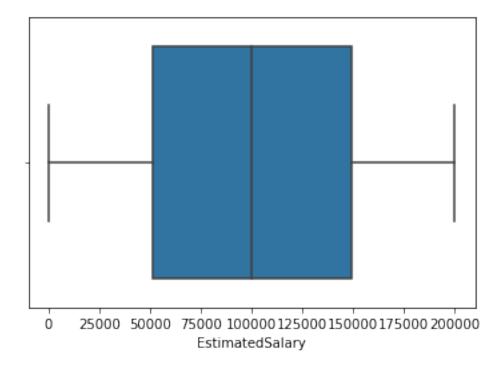

sns.boxplot(df['Balance'])

<AxesSubplot:xlabel='Balance'>

sns.boxplot(df['EstimatedSalary'])

<AxesSubplot:xlabel='EstimatedSalary'>

Outliers from Age and Credit Score columns are removed

7. Check for categorical column and perform encoding.

```
from sklearn.preprocessing import LabelEncoder
le = LabelEncoder()

df['Gender'] = le.fit_transform(df['Gender'])
df['Geography'] = le.fit_transform(df['Geography'])

df.head()
```

√Number	CustomerId	Surname	CreditScore	Geography	Gender
\					
1	15634602	Hargrave	619.0	0	0
				_	_
2	15647311	Hill	608.0	2	0

10. Train test split

1

4

```
from sklearn.model_selection import train_test_split
X_train,X_test,y_train,y_test =
train_test_split(data,target,test_size=0.25,random_state=101)
print(X_train.shape)
print(X_test.shape)
print(y_train.shape)
print(y_test.shape)
(7500, 10)
(2500, 10)
```

1

-0.365276

```
(7500,)
(2500,)
```

Conclusion:

- 1. The model is scaled using StandarScaler method.
- 2. The train and test split ratio is 15:5.
- 3. As it is a classification problem, basic algorithms can be used to build ML models.
